

CLAIMS

Having thus described our invention, what we claim as new and desire to secure by Letters Patent is:

- 1 1. An asymmetric two-way request-response
2 communication method providing communication between a client transceiver
3 servicing a user/application and a server transceiver while providing power
4 management and conservation of power at the client transceiver, comprising:
5 maintaining the client transceiver in a power-off state
6 until the client transceiver initiates a client communication with the server and
7 enters a power-on state;
8 the client transceiver initiates a client communication with the
9 server transceiver and requests information from the server transceiver;
10 the server transceiver transmits a server communication with
11 the requested information to the client transceiver;
12 the client transceiver receives the server communication and
13 then returns to a power-off state;
14 the server transceiver stays in a listening mode and waits for a
15 client communication, and the server transceiver does not transmit unsolicited server
16 communications to the client transceiver.
- 1 2. The method of claim 1, wherein the client transceiver has a
2 time-out period, after which the client transceiver enters a power-on state and
3 transmits a client communication to the server transceiver.
- 1 3. The method of claim 2, wherein the user/application defines the
2 time-out period.
- 1 4. The method of claim 2, wherein the server defines the time-out
2 period in a server communication.

1 5. The method of claim 4, wherein if the time-out period defined
2 by the server is less than the time-out period defined by the user/application, then the
3 time-out period defined by the server is used as the time-out period, and if the time-out
4 period defined by the server is greater than the time-out period defined by the
5 user/application, then the time-out period defined by the user/application is used as the
6 time-out period.

1 6. The method of claim 4, wherein if the time-out period defined
2 by the server is less than the time-out period defined by the user/application, then the
3 time-out period defined by the user/application is used as the time-out period, and if
4 the time-out period defined by the server is greater than the time-out period defined by
5 the user/application, then the time-out period defined by the server is used as the time-
6 out period.

1 7. The method of claim 1, wherein the method is employed with a
2 small, limited-power, wireless, mobile device.

1 8. The method of claim 1, wherein the method is employed with
2 one of a power badge, wireless toy, wireless sensor, wireless information access
3 device, digital cell phone, WAP phone, 2-way pager, interactive remote control,
4 personal digital assistant, mobile computer, intelligent object, and other pervasive
5 device.

1 9. The method of claim 1, further including providing the
2 user/application with a display of an 'until-when' parameter, specifying the time or
3 date until which the client transceiver will still operate.
